CPD examines how to specify 100% recycled lead

International Industrial Metals' RIBA-approved CPD, 'Lead – uniquely recycled for a better informed decision' examines the sophisticated process by which lead is extracted from car batteries to be re-formed as BS EN 12588 rolled lead sheet.

With only one such plant in the UK, over 95% of the constituent parts of any battery are recovered, this provides a total chain of custody and scope to specify Code 3-8 material which presents the lowest environmental impact.

Associated Lead Mills is one of the lead manufacturers belonging to the International Industrial Metals group.

With material uses extending from roofing to rainscreen panels, lead is the most recycled material in construction with a BRE Green Guide A+ rating.
