## **Daylight without Dazzle with the Help of Commercial Blinds**

***Health and safety looms large in the minds of company executives and optimising comfort for staff using computers is a high priority. With the latest figures from Ofcom suggesting that people now spend half their waking lives using digital devices, the potential for eyestrain from screen glare is ever-present.***

Office blinds specialist Commercial Blinds UK understands that with the large expanses of glass used in modern offices, it is crucial to reduce the amount of sunlight entering rooms. This is not only to reduce glare on computer monitors, but also to protect office carpets and furnishings from sunlight damage. Commercial Blinds UK has many years experience and can advise on the solution to suit the type of window and room purpose.

For glare reduction, vertical blinds are often the best option as they offer superb control over how much light is filtered into a room and can be rotated as the sun moves position. Fabric will diffuse light rather than reflect it, giving daylight without dazzle. Commercial Blinds UK has a huge range of colours and textures.

Positioning of the computer screen is also important; ideally the monitor should be at 90 degree angle from the source of light.

Large and small companies, schools, hospitals, building contractors and interior designers have all discovered the benefits of vertical blinds, which can be made to measure and fitted by Commercial Blinds within seven days.
