Updated RIBA Approved Floors Screeds CPD Launched By Flowcrete

Flowcrete has updated a popular RIBA Approved CPD, which is designed to help specifiers get the level best from flooring screeds.

Entitled 'Floor Screeds – How to Avoid Failure' the presentation outlines the different types of floor screeds and their applications, identifies areas of failure, and offers advice on the avoidance of problems.

The CPD also offers recommendations for the correct specification of sand and cement based screeds.

Aimed predominantly at architects specifying screed systems in [commercial environments](#), the CPD also caters for construction managers and other property professionals.

Alan Dean, Managing Director of Flowcrete, said: "Screeds are hidden away and less visible than many other construction products, but nevertheless have a vital role to play within the construction sector – in both new-build and refurbishment developments.

"Modern construction programmes place great demands on the products they use and today's floor screed systems are no exception, needing to be fast, strong, safe and able to cope with the rigorous techniques and methods undertaken throughout the world.

"Ultimately, this updated CPD helps ensure specifiers and those on-site get the best performance underfoot and a firm platform for their project."

For more 40 years, [Isocrete Floor Screeds](#) – which are manufactured by Flowcrete – have been the product of choice for architects and specifiers on some of the world's largest and most prestigious projects.

All over the globe, [Isocrete](#) has been used extensively across a broad range of developments, including airports, hotels, hospitals, residential sites, offices, shopping centres, schools, colleges and universities.

Flowcrete's new screed CPD joins the flooring manufacturer's existing professional development programmes, covering underfloor heating, decorative resin flooring, industrial resin flooring and car park decking.
