## Trailflex surface from Langford Direct perfect for golf club project

*Golfers and trees were kept happy when club bosses turned to Langford Direct looking for a slip-resistant pathway.*

Sale Golf Club, a well-established parkland course founded in 1913; required a long-lasting permeable surface for its pathway. Due to deeply embedded tree roots, there was a restricted dig out.

Flexible Trailflex, in Smoked Topaz colour, was chosen for the project. This is the perfect choice as it can be air bladed around roots then laid on a membrane, before directly onto the ground.

As the tree gets water through the highly porous surface, it is less likely to put out tapping roots seeking water from the surface. However, should this happen, Trailflex is flexible up to 90 degrees and will not crack under severe root intrusion.

Sale Golf Club's new pathway has a porosity of 80,000 litres of water per hour, with an industry first no-clog guarantee and no negative effect on its surrounding environment.
