Neaco's access walkways achieve global reach with airport demand

Architectural aluminium specialist Neaco has achieved a global market reach with a range of access walkways and associated handrails which have been specified in the redevelopment of some of the world's leading airports.

Neaco's modular walkway grilles and handrail systems provide safe, secure and long-term access solutions for general access, cleaning and maintenance of airport buildings. Suitable for a huge variety of installation requirements and ideal for roof access specifications, the products are featured in major expansion programmes at airports such as London Heathrow and Hong Kong.

Neaco's national sales manager, Richard Richardson-Derry, said: "Neaco has enjoyed a strong market presence in the airport sector for many years. Our aluminium modular grilles and handrails started attracting specifications for airport developments in the early nineties and demand has steadily grown ever since."

"We have been able to develop different design solutions for different requirements – from our original high-performance Techdek walkway system to our Paldek 2 walkway system which provides the ultimate in fast installation whilst complementing Techdek's appearance in dual specifications."

Neaco's modular walkway grilles combine lightweight construction for ease of handling with a patented swage-locked design which provides high structural efficiency and an impressive load-bearing capacity. Providing a free-draining grille surface with a serrated surface for non-slip qualities, they are extremely durable and eco-friendly with 100 per cent recyclability and low-energy assembly requiring no welding or hot works.

Neaco access walkways can suit most standing seam roofs with a unique fixing system which allows the roof access walkway to be installed without penetrating the roof surface. When required the modular grilles can also be installed with handrails to one side or both sides for extra safety.
