A breath of fresh air from the Platform Lift Company

A new air purifier product is available through the Platform Lift Company, which rapidly and safely disinfects air inside a lift. It efficiently supplements existing cleaning procedures, ensuring lift environments stay clean and fresh.

The air purifier works by circulating the air within an enclosed platform lift through a process of disinfection and purification. The unit incorporates the brand-new sterilization technology GERMAGIC™, an antimicrobial coating which gives "contact-killing", release-killing and "anti-adhesion" abilities to HEPA filters, and a leak-free UV Photo Catalyst, obliterating more than 99% of viruses and bacteria.

Activated using biological recognition technology, air starts being purified from the moment a passenger enters the lift until the moment they exit. With a delayed shut down, the Lift Air Purifier continues to operate to ensure the air within the lift has been fully disinfected before returning to standby mode.

The bacteria-killing rate of the air purifier product can reach 99.05%, with a removal rate of 99.76% for influenza virus and a killing rate of 98% for Middle East Respiratory Syndrome Coronavirus (MERS Cov).

Any type of enclosed platform lift, including commercial and home lifts, can be easily installed with the air purifier system by the Platform Lift Company's qualified engineers. Installation and filter changes can be carried out as part of service agreements.

For more information or to arrange installation, please call 01256 896000 or contact the team through the website.
