Platform Lift Company product ensures lift cleanliness

Created in response to Covid-19, a revolutionary new [professional lift sanitiser](#) is now available through The Platform Lift Company. Developed in Italy, the lift sanitiser system (ISO certified device) uses innovative air and light technology to sanitise lift cabins with antimicrobial cleaning.

The way it works is refreshingly simple: the automated device includes a fast-acting Absolute HEPA filter, combined with an activated charcoal membrane to continuously sanitise the air, and a UVGI LED light which has hospital-grade antimicrobial properties to efficiently sterilise all surfaces.

Air is vacuumed from the lift cabin then channelled through pipes to the device where it is filtered and purified from any virus and bacteria, before being safely circulated back to the lift.

The CARE lift sanitiser is located on the lift car/cabin roof. Holes are required for the installation of the air vents and the UVGI LED light. The pipes and ducts to the device sit above the roof. It is connected to the lift's existing power supply.

The UVC LED ultraviolet light is the same germicidal UVGI (Ultraviolet Germicidal Irradiation) technology used for sanitising hospitals. Reassuringly, it guarantees the complete and instantaneous sterilisation of the lift cabin, removing 99.9% of microorganisms from all surfaces. The UVGI LED light is automatically activated in the stand-by phase when there are no passengers inside the lift.

What's more, any type of passenger or enclosed platform lift can be retrofitted with the [lift sanitiser](#) – and the fully qualified and certified engineers at the Platform Lift Company can fit the system in just a few hours.
