23rd June 2010

RENSON® Fixscreen® 100^{EVO} windproof vertical sun screen with Connect & Go technology

RENSON®, trendsetter in ventilation and sun protection, optimizes the quality, design and ease of installation of its windproof screens and introduces the Fixscreen® 100^{EVO}.

Just like the first version this screen is windproof in any position thanks to the Fixscreen®-technology. The patented Connect & Go technology of RENSON® now allows the fabric roller barrel to be installed and removed very easily. No more problems with electrical cables when replacing the fabric or motor. The new aluminium side covers and the cable slot in the guides are further innovations that improve the comfort for installer and user.

The Fixscreen® is the first screen in the world that is truly wind-resistant and insect proof. This system uses the ingenious zip system of the Fixscreen®-technology. This zip is securely welded onto the edge of the screen which slides into the side guides of the system, making the screen wind-resistant in every position. The screen is equipped with a bottom rail made of extruded aluminium and provided with a rubber seal to close perfectly with the threshold. This makes the screen insect repellent when fully closed. Rattling and ripped screens belong to the past.

Today, RENSON® introduces the Fixscreen® 100^{EVO}, which offers the best in quality, design and ease of installation. The incorporation of the Connect & Go technology allows the fabric roller to be installed and removed very easily. No more problems with electrical cables when securing the cassette or replacing the fabric or motor. Furthermore, the cable slot in the side channels allows the electrical cable to be concealed quickly and easily.

The new aluminium side covers provide extra stability and can be coated together with the profiles for greater aesthetical appeal. The Fixscreen® 100^{EVO} can be combined with fibreglass, Soltis®- or Sunworker® fabrics with a very high sun protection factor. It can also be delivered with insect screen or blackout fabric (for inside applications). These screens maintain their shape, are unaffected by humidity and heat, and are rot-free and colourfast. The special grooved roller barrel, around which the fabric is rolled, is made of galvanised steel with conically shaped endpieces in order to compensate for the thicker ends of the rolled up zip.

The Fixscreen® 100^{EVO} is ideal for glazing up to 4 m wide and 2.7 m high or 3 m wide and 3.5 m high. It can be used for domestic construction, commercial buildings or other building projects like schools and

Creating healthy spaces

hospitals. The Fixscreen® 100^{EVO} can be designed-in for an optimal hidden installation or retrofitted on all window types (aluminium, wood, PVC).
